1. Accounts the client should create now

Google Play Console

For an organization account, the client will likely need:

- Legal organization name and address.
- D-U-N-S number.
- Organization website.
- Organization phone number.
- Official company email.
- Contact person details.
- Government ID for the authorized representative.
- Official company documents, such as commercial registration, incorporation certificate, business license, or tax/VAT certificate.
- A Google Payments profile linked to the organization. (Google Help)

Google may publicly show the organization’ s legal name, address, developer email, and developer phone number on Google Play. (Google Help)

For a new personal Google Play account, Google also requires device verification plus the 12 testers / 14-day closed-test rule before production publishing. Since this is a company financial app, avoid personal account setup. (Google Help)

Apple Developer + App Store Connect

For an organization account, the client will need:

- A legal company entity, not merely a trade name.
- D-U-N-S number.
- Apple Account with two-factor authentication.
- Legal first and last name for the Account Holder.
- Authority to sign legal agreements for the company.
- Company contact details. (Apple Developer)

The company name becomes the seller/developer name shown on the App Store. (Apple Developer)

---

2. Store listing content you will need to prepare

Both stores need marketing content, not just code:

- App name.
- Short description / subtitle.
- Full description.
- App icon.
- Screenshots for supported phone sizes.
- Possibly tablet screenshots if iPad/tablet support is enabled.
- Category, such as Finance.
- Support email.
- Support website.
- Privacy-policy URL.
- Copyright / company ownership details.
- Countries where the app will be available.
- Languages, such as Arabic and English.
- Pricing: free, paid, subscriptions, or in-app purchases.

Apple requires screenshots/app previews as part of the product page flow, and its privacy-policy URL is required for iOS apps. (Apple Developer)
Google requires accurate store metadata and app information before submission. (Google Help)

---

3. Privacy and data forms

This is usually the most annoying part.

Google Play: Data Safety form

You must declare:

- What user data is collected.
- Whether data is shared with third parties.
- Why each data type is collected.
- Whether it is encrypted in transit.

- Whether users can request data deletion.
- Whether the app uses analytics, crash reporting, push notifications, authentication, location, contacts, camera, files, etc.
- Data behavior of third-party SDKs too, such as Firebase, OneSignal, Sentry, analytics tools, or payment SDKs.

Google requires a privacy policy and expects the Data Safety form to match actual app behavior and installed SDKs. (Google Help)

Apple: App Privacy "nutrition label"

Apple asks you to declare:

- Data linked to the user, such as name, email, phone, account ID, financial information, usage data, diagnostics, identifiers.
- Why it is used.
- Whether it is used for tracking.
- Data collected by your own backend and third-party SDKs.
- Privacy policy URL.

Apple requires the privacy policy both in App Store Connect and inside the app in an easy-to-find place. (Apple Developer)

For your project, push notifications may mean device tokens are stored. Authentication likely means email, name, account identifiers, and usage data. You need to map the real backend, Firebase/Expo/OneSignal setup, analytics, and crash tools before filling these forms.

---

4. Content, age, and special declarations

You will answer questionnaires such as:

Google Play

- Does the app contain ads?
- Is login required?
- Does the reviewer need a demo account?
- Does the app target children?
- Content rating questionnaire.
- Target audience and age group.

- Financial features declaration, if relevant.
- Sensitive permissions declaration, if using location, storage/files, camera, notifications, etc.
- Whether the app contains news, health, gambling, crypto, lending, or other regulated functions.

Google requires reviewers to have working access, including login credentials, QR codes, demo data, or anything else needed to review the app. (Google Help)

Apple

- Age-rating questionnaire.
- App privacy information.
- Export-compliance questions, usually about encryption.
- App Review Information: contact person, phone, email, review notes, and demo login.
- Content rights confirmation: you own or are allowed to use logos, fund data, charts, images, and branding.
- Whether the app contains regulated medical content in special cases.

Apple's age rating is required, and Apple uses export-compliance questions to determine encryption-related requirements. (Apple Developer)

---

5. Things your project specifically should prepare

For this investment/funds app, prepare these early:

1. **Privacy policy** in Arabic and ideally English.
2. **Terms of use / disclaimer**, especially that information is not financial advice if applicable.
3. **Company legal identity** and support contact details.
4. **Proof that fund prices, logos, charts, and financial data are licensed or permitted.**
5. **A reviewer demo account** with realistic fake/demo investment data.
6. **A way for users to delete their account/data**, if users create accounts.
7. **Notification explanation**, including why users receive fund/watchlist notifications.
8. **Push permission wording** inside the app.
9. **Screenshots and store text**, likely Arabic first, plus English if publishing globally.

10. **A clear answer on whether users can buy, sell, trade, transfer money, or only monitor investments.**

That last point matters a lot. An app that only displays fund information is simpler than one that allows buying, selling, deposits, withdrawals, or investment transactions.

---

6. What should be client responsibility vs your responsibility

Client should provide:

- Apple and Google organization accounts.
- D-U-N-S number.
- Company documents and legal identity.
- Official company email/domain.
- Privacy policy, terms, financial disclaimer, and legal approval.
- Rights/licenses for financial data and logos.
- Testers for Google Play if Google applies the testing rule.
- Final approval of store descriptions and screenshots.

You should handle:

- Expo/EAS build setup.
- Bundle IDs and package names.
- Store listing draft.
- Screenshots and app assets.
- Privacy/data inventory based on the actual code and SDKs.
- Demo account setup.
- TestFlight and Google Play test release.
- Submission technical steps and fixing review feedback.

So yes: treat publishing as a real separate deliverable, not “extra five days after coding.” The form work can start during development, but the final declarations should only be submitted after the app’s SDKs, analytics, auth, notifications, and data handling are finalized.
